

The Employee Educational Report was recently modified to include changes to the selection screen and the report's output format. For those agencies that log educational information on IT0022, this report is used to verify information captured in ISIS. A new selection option allows users to output all employees, whether an IT0022 record exists or not. This can be helpful to agencies who recently began utilizing this infotype to identify employees who still need to have the infotype created. IT0022 and this report come in handy when agencies need to identify the potential applicant pool for departmental vacancies that require specific degree types.

ZP41 is the first ISIS HR report to adopt SAP's latest ALV (list viewer) format, which is illustrated below.

In addition to a reformatted report header, please also note the new positioning of the ALV tool bar. The functions available to users for manipulation of output data remain basically the same, although several of the icons have taken on a new look. To determine what function an icon delivers, simply place your cursor over that icon and its descriptive text will display. For more information on any ALV functions, refer to the [ISIS HR Reports Manual](#). For more information on the report itself, refer to [ZP41 Report Descriptor](#).
